

Hunter Eddington

IAM Engineer II

hunter@eddington.tech | linkedin.com/in/hunter-e-578660371 | github.com/Nerdykidtech | Eddington.Tech

Summary

I build and break things in the identity and security space. Most days I'm somewhere between writing automation scripts, hardening cloud infra, and figuring out why a Roku channel won't launch. Came up through self-teaching and stubbornness—no CS degree, just a lot of late nights and broken builds that eventually worked.

Technical Skills

Identity & Security: IAM, identity governance, zero trust architecture, cloud hardening, threat intel, SOC workflows

Languages: Python, JavaScript/TypeScript, Swift, Kotlin, Java, Bash

Cloud & Infra: AWS, Azure, Docker, systemd, CI/CD, self-hosted automation

Development: Next.js, React, SwiftUI, BrightScript (Roku), Android Automotive, Gradle

Tools: SIEMs, vulnerability scanners, compliance frameworks, incident response platforms

Experience

IAM Engineer II

Current role — Identity governance, cloud automation, zero trust

Day-to-day is designing identity workflows at scale, automating zero trust components, and keeping cloud environments from turning into Swiss cheese. Also write internal security docs and threat analysis when something needs explaining.

Projects

Nuvio

Streaming channel for Roku + Android Automotive app

Built the whole thing from scratch. Roku side uses SceneGraph with QR auth; Android Automotive variant handles in-vehicle distribution requirements. Got the Roku launch time under 2.5 seconds after way too much profiling.

Autheris

iOS 2FA app — open source

SwiftUI-based TOTP generator. No cloud, no analytics, no tracking—just local secure storage using the enclave. On the App Store if you need a 2FA app that doesn't phone home.

Security Blog Pipeline

Automated content system

Python pipeline that watches RSS feeds, pulls interesting security stories, and handles the whole publishing flow to LinkedIn. Runs on cron, self-hosted, uses Firecrawl and Jina for extraction. Has duplicate detection and auto-categorization baked in.

Writing

I publish regular security content—mostly IAM hardening, practical threat analysis, and the occasional deep dive when something interesting breaks (BitLocker bypasses, AI social engineering campaigns, that sort of thing).

Education

Self-taught. Learned by building stuff that broke, fixing it, and repeating. No traditional CS background—just projects, documentation, and figuring things out as I go.

Open to contract work, consulting, or full-time roles in security engineering or IAM architecture.
